SEARCHES FOR MONOPOLES, SUPERSYMMETRY, TECHNICOLOR, COMPOSITENESS, EXTRA DIMENSIONS, etc.

Magnetic Monopole Searches

Isolated supermassive monopole candidate events have not been confirmed. The most sensitive experiments obtain negative results.

Best cosmic-ray supermassive monopole flux limit:

$$<~1.0\times 10^{-15}~{\rm cm}^{-2}{\rm sr}^{-1}{\rm s}^{-1}~~{\rm for}~1.1\times 10^{-4}<\beta<0.1$$

Supersymmetric Particle Searches

Limits are based on the Minimal Supersymmetric Standard Model.

Assumptions include: 1) $\widetilde{\chi}_1^0$ (or $\widetilde{\gamma}$) is lightest supersymmetric particle;

2) R-parity is conserved; 3) With the exception of \widetilde{t} and \widetilde{b} , all scalar quarks are assumed to be degenerate in mass and $m_{\widetilde{q}_R} = m_{\widetilde{q}_L}$. 4) Limits for sleptons refer to the $\widetilde{\ell}_R$ states. 5) Gaugino mass unification at the GUT scale.

See the Particle Listings for a Note giving details of supersymmetry.

$$\widetilde{g}$$
 — gluino

The limits summarised here refer to the high-mass region ($m_{\widetilde{g}} \gtrsim 5 \, \text{GeV}$), and include the effects of cascade decays, evaluated assuming a fixed value of the parameters μ and $\tan\beta$. The limits are weakly sensitive to these parameters over much of parameter space. Limits assume GUT relations between gaugino masses and the gauge coupling,

Mass $m>392$ GeV, CL = 95% $[m_{\widetilde{q}}=m_{\widetilde{g}}]$

Technicolor

Searches for a color-octet techni- ρ constrain its mass to be greater than 260 to 480 GeV, depending on allowed decay channels. Similar bounds exist on the color-octet techni- ω .

If the Lagrangian has the form

$$\pm \frac{g^2}{2\Lambda^2} \, \overline{\psi}_{\mathsf{L}} \gamma_{\mu} \psi_{\mathsf{L}} \overline{\psi}_{\mathsf{L}} \gamma^{\mu} \psi_{\mathsf{L}}$$
